

PROJECT ABSTRACT

A good Full Stack project abstract should give a clear and concise overview of the project, covering the problem it solves, the technologies used, and the overall architecture (frontend, backend, database, etc.). It should also mention any key features and the final outcome or impact of the project.

- **Title of the Project**
- **Problem Statement** – What problem or need does this project address?, any existing project what are issues in the existing system, how your system is better than existing.
- **Objective / Goal** – What is the purpose of the project?
- **Technologies Used** – Frontend, Backend, Database, etc.
- **Architecture Overview** – Basic description of how components interact.
- **Key Features** – Main features and functionalities.
- **Key Project Phases** – Two phases to cover the mid-term and end-term
- **Project Phases & Timeline:** The development process followed an 4-month plan, covering all critical aspects from planning to deployment. Below is the Gantt chart representing the timeline.
- **Conclusion / Outcome/Bugs/Future Scope** – What has been achieved or how the system helps users.

Sample Abstract

Project Title: *Online Event Booking System*

Abstract:

The Online Event Booking System is a full stack web application designed to simplify the process of discovering and booking tickets for events such as concerts, workshops, and conferences. The platform addresses the inefficiency in manual booking processes and provides users with a centralized solution for event discovery, booking, and payment.

The primary objective of this system is to offer a responsive and user-friendly interface for attendees to browse events and purchase tickets, while also allowing organizers to create and manage events.

The frontend of the application is built using **React.js** for dynamic user interaction and responsiveness. The backend is powered by **Node.js with Express**, providing RESTful APIs and handling business logic. **MongoDB** is used as the database to store user, event, and transaction details. **JWT-based authentication** ensures secure login and role-based access control for users and organizers.

Key features of the system include user registration and login, event listing and search, online booking with payment integration (e.g., Stripe), admin dashboard for event management, and real-time ticket availability updates.

This project showcases the integration of modern frontend and backend technologies to build a scalable and maintainable application, providing a complete event booking solution to both users and organizers.

Key Project Phases

Break the project into major phases. For a typical Full Stack project, you can use:

Phase	Description
1. Requirement Analysis	Understand the problem, gather user needs, define scope.
2. System Design	Plan UI/UX, backend architecture, database schema.
3. Frontend Development	Build user interfaces using frameworks like React, Vue, etc.
4. Backend Development	Develop REST APIs, authentication, business logic.
5. Database Integration	Design and integrate the database (e.g., MongoDB, MySQL).
6. Testing & Debugging	Unit testing, integration testing, and bug fixing.
7. Deployment	Hosting on platforms like Vercel, Netlify, or AWS.
8. Documentation & Final Report	Project write-up, user guide, and maintenance manual.

Example Gantt Chart (in Markdown-style Table)

Phase	Week 1	Week 2	Week 3	Week 4	Week 5	Week 6	Week 7	Week 8
Requirement Analysis	■							
System Design		■						
Frontend Development		■	■					
Backend Development			■	■				
Database Integration				■				
Testing & Debugging					■	■		
Deployment						■		
Documentation & Report							■	■
